

GenAI Assistant Dossier

How we worked with AI assistants

Purpose

In this assignment, you will document how your team used generative AI conversational assistants (ChatGPT, Claude, Gemini, Perplexity, Qwen, Kimi, Minimax, etc.) as *working tools* in your innovation-semester Games for Change project. The goal is to show both:

- **Breadth:** the different roles you gave assistants (researcher, ideation partner, planner, critic, coder, copywriter, etc.).
- **Depth:** how thoughtfully and critically you used them (iteration, verification, template prompts, context management, identifying limits).

A superficial “one-click text generator” approach will not be enough for a good grade.

Deliverables (per group)

Submit a **GenAI Assistant Dossier** (≈ 6-10 pages total, including screenshots) containing:

1. Prompt & Template Library (2–3 pages)

- 6 to 10 of your best prompts, grouped by use case (e.g., research, ideation, planning, validation, coding, content creation).
- At least 2 prompts should be reusable **templates** following the director’s mindset (role, context, mission, format, style). For each template, briefly explain when and why you use it.

2. Conversation Excerpts with Commentary (2–3 pages)

- 3–5 short excerpts (or screenshots) from important assistant interactions during the project.
- For each excerpt (max half a page):
 - Context: what were you trying to achieve (e.g., refine project framing, design a game mechanic, debug pseudo-code ...)?
 - What the assistant produced (brief description, not full transcript).
 - Your critique: what was useful, what was wrong/misleading, what you changed or checked, what you learned.Show at least one example where you **disagreed with or corrected** the assistant.

3. Experiment Log – Iterations and Decisions (1–2 pages)

- A concise log or table showing:
 - Prompt or experiment
 - Tool used
 - Iterations (how you refined the prompt)
 - Outcome: accepted, modified, or rejected
 - Impact on the project (what changed in your concept, design, or implementation).
- Include at least one **diverge & converge** sequence (get lots of ideas, then narrow and synthesise your own solution).

4. Integration into the Innovation Project (1–2 pages)

- Explain concretely where assistant use shows up in your **final project**, e.g.:
 - problem framing and narrative (e.g., how you defined the system-level problem and story).
 - Game, demo mechanics and interaction design.
 - IoT concept or technical design (architecture sketches, pseudo-code, test ideas, etc.).
- Reference 3–5 specific project artifacts (slides, diagrams, text, code) and explain: “This part was improved by GenAI in this way...”.

5. Individual Reflections (≈ 1 paragraph per student in the group)

- Each team member writes their own paragraph:
 - What they personally used assistants for.
 - One success and one failure/problem.
 - What they learned about the strengths and limits of assistants for engineering/innovation work.

Practical Aspects:

- Format: PDF, clear section titles, group name, group members.
- Length: guideline 6–10 pages (can be slightly shorter or longer if the content is dense and well structured).
- Deadline: May 17, midnight.
- This dossier focuses on **how you worked** with AI, not on the technical correctness of your implementation.

Weight: 50% of the course grade (group grade, with individual reflections), including the group presentation score
