

# URBAN GLOW GRID

## OPERATOR QUICK GUIDE

Your objective is to balance the city's energy demand across 6 iconic zones. Prove your efficiency in under 3 minutes.

### 1 Initialize System

Press the **START** button on the console to begin. You have exactly **3 minutes**.

The city's power grid will immediately become unstable, and the 6 zones will start offline.

**PRESS START**

### 2 Connect Zones

Gain control of the grid by connecting to all 6 zones. Turn each physical dial until the zone's LED indicator flashes **GREEN**.

Once connected, your dial actively controls that zone's energy output.

● **CONNECTED**

### 3 Balance The Grid

The city's total energy load fluctuates constantly. Watch the OLED screen.

Adjust your dials to keep the consumption indicator (=) safely between the 2 vertical limit markers (|).

=====

-- ]

### 4 Prevent Blackouts

If a zone is poorly optimized, it will disconnect and its LED will flash **RED**.

You must quickly turn its dial to reconnect it before the overall grid balance fails.

● **RECONNECT!**

### MISSION SUCCESS

- ▶ **CONNECT ALL ZONES:** Ensure all 6 zones are active (Green).
- ▶ **MAINTAIN BALANCE:** Keep the grid **5** perfectly stable **consecutive** (between **seconds** limits) for
- ▶ **SURVIVE:** Complete these tasks before the 3-minute timer runs out.

**SPEEDRUN SCORE = REMAINING TIME**

### SYSTEM FAILURE

- ▶ **TIME OUT:** The 3-minute timer expires before you stabilize the grid.
- ▶ **OVERLOAD (> 80%):** The total energy exceeds the maximum limit (right side of the gauge).
- ▶ **UNDERLOAD (< 25%):** The total energy drops below the minimum limit (left side of the gauge).

**You have 2.5 seconds to fix limit breaches!**
