Slide 1 Intro

Abir

0:00 - 0:10

"Good morning everyone. We are Team 22. This is Urban Glow Grid: a tangible way to master energy."

Slide 2 The Problem

Abir

0:10 - 0:30

"Today, we face a critical problem: energy blindness. We consume energy blindly. We can't see it. This invisible action leads to wasteful habits and system strain. The final result? Blackouts. We need to fix this."

Slide 3 Our Solution

Abir

0:30 - 0:50

"Our solution is right here: a 1 to 15,000 scale interactive model of Paris. Users act as Chief Engineers. They physically manage power fluctuations in real-time. We use bright LEDs to provide instant visual feedback on the grid's health."

Slide 4 Why Play?

Mohamed

0:50 - 1:10

"Why play this game? To make abstract data physical. We replace boring apps with active physical engagement. Our ultimate goal is to empower citizens. We want to train people to save the grid."

"The experience is simple. First, connect the zones blindly using potentiometers. Second, monitor the overall grid using our OLED visualizer. It uses universal colors: green for stable, red for danger. Your goal is to balance the power and prevent blackouts."

"Who is this for? We target two distinct markets. First, the B2B EdTech sector for schools adopting sustainability goals. Second, the B2G Smart City sector for municipalities wanting to actively engage their citizens."

"From a financial perspective, this project is highly profitable. We used open-source components like Arduino and LEDs. Our Bill of Materials strictly totals under 200 RMB. This allows us to package high-margin educational kits while keeping hardware costs incredibly low."

"To scale production, we will move from breadboards to custom Printed Circuit Boards. This will reduce assembly time by 95%. Our modular architecture means we can ship miniature classroom kits, or build giant interactive installations for museums."

"Of course, building this was an engineering battle. We managed nearly 90 cables in a saturated space. We debugged unstable loose connections from jumper wires. And we meticulously balanced current to power LEDs and audio simultaneously."

"Why us? Because Team 22 is the perfect blend of vision and engineering. We turned a complex prototype into a scalable product in just weeks."

"Energy shouldn't be invisible. Master energy. Thank you, we are now ready for your questions."
